

ARRANGEMENT FOR A PISTON AND CYLINDER DEVICE

Abstract

5 The hydraulic cylinder or shock absorber arrangement
has a cylinder unit limiting an inner space in which a medium
in the form of a gas or a liquid is intended to be placed. A
forwardly and backwardly movable piston unit is placed such
that it can slide within the space that is defined by the
piston into a first chamber and a second chamber. An
10 inlet/outlet is defined in the respective chambers of the
cylinder unit for the addition to and removal of medium from
the chambers together with devices that co-acts in order to
determine the relative position of the piston within the
cylinder unit.
